Summary

- M.Sc. Interactive Digital Media (Trinity College Dublin) and B.Tech Computer Science graduate who designs products and builds them. As Product Design Engineer at Cimelium (ADAPT Centre), designed and launched cimelium.com and its design system, and directed a multi-agent engineering workflow through a 5-sprint platform modernisation. Built Settld, StyleBook AI and Work Hive end to end, from research and interface design to data models and live deployment.

Education

- **Trinity College Dublin** Sep 2025 – Sep 2026
  M.Sc. Interactive Digital Media (69%)
  - Coursework projects in full-stack development with Java, web design, AR/VR, graphic design, game design, video editing and 3D modelling in Blender.
- **Anurag University** Oct 2021 – May 2025
  B.Tech Computer Science and Engineering (GPA: 8.09/10)
  - Worked in SQL, Python, Java, JavaScript and React.
  - Major project: co-authored a research paper and report on a low-cost solar tracking device.

Experience

- **Product Design Engineer, Cimelium (ADAPT Centre, Trinity College Dublin)** Jul 2026 – Present
  Design
  - Designed and launched cimelium.com, the marketing site for an AI-powered art-market platform, including page layouts, the pilot partner programme section and the "Book a call" conversion flow.
  - Audited 30+ art-world and art-tech platforms (auction houses, marketplaces, galleries, museums, software) on colour, typography and UI patterns, then developed 11 visual identity directions and moodboards that drove stakeholder decisions on brand tone, imagery and colour.
  - Built the core design system (Merriweather and DM Sans, tinted surfaces, a single brick accent, WCAG-compliant contrast) and designed client workspace concepts covering inventory, enquiry dashboards, AI-drafted replies and task automation.

  Product engineering
  - Owned product decisions across a 5-sprint modernisation of Cimelium's internal app-starter platform, including scope cuts, risk trade-offs and sign-off at every stage gate, working alongside fellow developers and reporting to the manager for his input.
  - Directed an AI-agent-driven engineering workflow (Agent SCRUM), taking autonomous agents through planning, development, independent testing and release, with a separate agent verifying each stage before it could proceed.
  - Drove a full app rebuild as the proof of concept, held to zero unaccepted differences, and signed off UAT on independently re-verified numbers. Approved every production change against its diffs and test results.
  - Built a Python (OpenCV, NumPy) pipeline that detects and crops artwork from about 3,700 museum photographs, reviewing the outputs and recording the cases that needed manual attention.
- **Product Associate, DreamWeavers** Feb 2025 – Aug 2025
  - Defined requirements and use cases alongside engineers, documented decisions and stayed involved through QA and release, cutting feature delivery time by 25%.
  - Analysed user behaviour and product data, including Google Analytics 4 funnel tracking, into recommendations that contributed to a 15% lift in product performance.
  - Handled SEO for the PawFect product and designed WCAG-aligned interfaces.
  - Used structured analysis to pressure-test ideas and align stakeholders before any build work began, reducing ambiguity across multiple releases.
- **UI/UX Design Intern, Divine Labs (IIT Delhi)** Mar 2024 – May 2024
  - Collected and surveyed user data and ran usability tests before engineering handoff, documenting findings and iterating on feedback, which improved key metrics by 40%.
  - Restructured interaction flows in data-dense dashboards after a systematic review of user behaviour, reducing usability issues by 25%.
  - Designed WCAG-aligned interfaces with Google Material Design, used Playwright for automated UI tests and Jira to track work.

Projects

- **StyleBook AI** (AI Design System Generator, Project Lead, team of four, Summer 2026)
  - Pitched the idea and led a team of four as project manager and lead engineer (207 of 212 commits), building with Claude Code on Next.js, TypeScript, Supabase and Google Gemini. A written brand brief becomes an editable design system, exportable in nine formats or to Figma through a plugin published to the Figma Community.
  - Tested the outputs by hand and found early generations vague, then redesigned the prompt structure to break each brief into its parts, making results specific to the brief. A shortlisting step makes the model choose from about 1,900 real colours and fonts.
  - Testing caught the model claiming a button passed 4.5:1 contrast when it did not, so every colour pair is now measured and repaired in code and unfixable cases are shown as deviations. Ran an accessibility audit and shipped with 28 passing tests.
- **Settld** (Dublin Renting Tool, Solo Project, Nov 2026, live and pre-launch)
  - Designed and built alone a live web app that helps students choose where to live in Dublin, ranking 106 areas for nine colleges on rent, the real 8am journey and local work (React, Postgres, Vercel, built with Claude Code).
  - Built the data pipeline on open government data and wrote my own routing engine (Connection Scan Algorithm) over transport timetables with live delay data, running in the browser.
  - Every figure shows a label, confidence level, source and date. Back-tested the rent model against 132 published figures (median error 2.0%), and turned two data errors found by inspecting output into build checks backed by 27 unit tests.
- **Work Hive** (Hiring Platform, Solo Project, 2026)
  - Designed and built a hiring platform where named, job-specific endorsements from real colleagues travel with each application: 18 screens on a live backend (React, Vite, Supabase Postgres, Auth and Storage, GitHub Actions).
  - Prototyped first and walked every flow as a candidate to find dead ends, then modelled 100 companies and 111 jobs so all 13 search facets return genuinely different results.
  - Wrote Row Level Security for all 20 tables and verified it with a second account querying the API directly, confirming it could not read another user's applications, messages or profile.

Achievements

- **Speaker, Official Claude Code Event, Dublin** May 2026
  Explained practical uses of Claude Code to a room of around 100 people at an event hosted by Claude Code's ambassador.
- **Runner-Up, Bower School AI Hackathon, T-Hub Hyderabad (100+ teams)** Sep 2024
  Built DAYA, a RAG-powered behavioural support platform for caregivers (Next.js, TypeScript, Claude API, pgvector).
- **Second Runner-Up, Microsoft InnoQuest Hackathon (80+ teams)** Jun 2024
  Built an AI-driven campus venue booking platform that automated scheduling and approvals.
- **Team Lead, Data Dynamo Hackathon (Qlik Sense)**
  Led the analysis and dashboards that found products priced above $75 were over-discounted, estimating close to $1M of recoverable profit.

Certifications

- Scrum Fundamentals Certified (SFC), SCRUMstudy; AWS Certified Cloud Practitioner; Google UX Design Professional Certificate

Skills

- **Design:** Figma, FigJam, Adobe Creative Suite, Claude Design, Google Stitch, design systems, WCAG accessibility, user research, usability testing
- **Data & analytics:** Python (OpenCV, NumPy), SQL, Postgres, Qlik Sense, Google Analytics 4, funnel analysis, data visualisation
- **Engineering:** TypeScript, JavaScript, React, Next.js, Vite, Node.js, Supabase, REST APIs, Git, GitHub Actions, Playwright
- **AI & workflow:** Claude Code, Claude API, Gemini API, Cursor, RAG (pgvector), Jira, Scrum, AWS
